Fracture occurs in the Johnson-Cook model when the damage parameter D exceeds 1.0. The evolution of D is given by the accumulated incremental effective plastic strains divided by the current strain at fracture = $\int \Delta \epsilon_{eff} d\epsilon_{eff} / \epsilon_{eff}^0$ failure p D $\epsilon \in$ During the calculation, element stresses are all set to zero and remain equal to zero when the fracture ...

Part one of the book reviews the damage development in composite materials such as generic damage and damage accumulation in textile composites and under multiaxial loading, while part two focuses on the modeling of failure mechanisms in composite materials with attention given to fibre/matrix cracking and debonding, compression failure, and delamination fracture. Final sections examine the modeling of damage and materials response in composite materials, including micro-level and multi ...

Modeling Fracture and Failure with Abaqus lecture notes

The study presented in this paper is pertinent to modeling brittle failure of ferritic steels with multiple failure mechanisms. More specifically, aged low alloy steels in the case where the ageing introduces a second mechanism of brittle failure that alters the fracture toughness distribution from being unimodal to bimodal.

A weakest-link model for multiple mechanism brittle

In the fracture continuum approach, discrete fractures are mapped onto a fine numerical grid of continuum elements and we modify the properties of those continuum elements adequately and as accurately as possible to represent the hydraulic and mechanical behavior of the fractures. Moreover, for modeling failure in tension and shear, including hydraulic fracturing, an elastic-brittle stress-strain relation is used, with the degradation of the mechanical properties of continuum elements ...

In the past decades, numerous experimental and numerical studies have been conducted on the mechanical behavior of laminated glass, particularly on the failure mechanism and fracture modeling. For example, Muralidhar et al. [1] and Xu et al. [2] experimentally investigated the debonding of glass-polymer interface under quasi-static and dynamic ...

Fractography is widely used with fracture mechanics to understand the causes of failures and also verify the theoretical failure predictions with real life failures. The prediction of crack growth is at the heart of the damage tolerance mechanical design discipline. There are three ways of applying a force to enable a crack to propagate:

A key feature of the model is that both the inter-layer fracture (weak plane failure) and cross-layer fracture (max principal stress failure) are taken into account jointly to determine the crack initiation and propagation, which is able to capture the crack kinks observed in obliquely layered samples.

In particular, when α is 0° , the failure mechanism is mainly matrix tension for HS model, which leads to a much higher failure strength than that of other two models (LS and MS models). When α increases to 30° and 60° , the variation in cohesion strength has limited influence on the shale failure behavior, revealed by the failure strength and fracture patterns (Figs. 15 b, 17).
